Abstract:

In all the organization, institute, company and corporation underrated, undervalued and underutilized; events management is most often rated as a tedious and ungrateful task. System administrators shy away from event logs and the events contained within, citing lack of time and clear definitions to the events produced as the principle detractors to the events management process. Events however constitute an invaluable source of information that can be utilized in a number of processes such as fact finding and decision-making. Various laws also mandate that logs have to be maintained and reviewed. So it is difficult to collect and maintain timely & effective data from the traditional system.

In this research paper researcher discussed conceptual framework of technology based event management DSS system as well as discussed it with case physical event management system.

Keywords: *Event management, DSS, Statistical techniques, data management, Data warehousing, Data Mining.*
